## Visione Generale

### Definizione

**Static program analysis/static code analysis** is the **analysis of computer software** that is performed **without actually executing programs**, in contrast with dynamic analysis, which is analysis performed on programs while they are executing. In most cases the analysis is performed on some version of the source code, and in the other cases, some form of the object code.

The term is usually applied to the **analysis performed by an automated tool**, with **human analysis** being called program understanding, program comprehension, or code review. Software inspections and software walkthroughs are also used in the latter case.

Appartiene alle seguenti categorie di test:

- **Test statico**: non richiede l'esecuzione
- **White Box**: è presente il codice sorgente
- **Test Non Funzionale**

### Definizione

**Automated code review** software **checks source code for compliance** with a **predefined set of rules or best practices**. The use of analytical methods to inspect and review source code to detect bugs has been a **standard development practice**. This process can be accomplished both manually and in an automated fashion. With automation, software tools provide assistance with the code review and inspection process. **The review program or tool typically displays a list of warnings** (violations of programming standards). A review program can also provide an automated or a programmer-assisted way to correct the issues found. This is a component for mastering easily software. This is contributing to the Software Intelligence practice.

Some static code analysis tools can be used to assist with automated code review. They do not compare favorably to manual reviews, however **they can be done faster** and more efficiently. These tools also **encapsulate deep knowledge of underlying rules and semantics** required to perform this type analysis such that it does not require the human code reviewer to have the same level of expertise as an expert human auditor.

### Teoria delle finestre rotte

La **teoria delle finestre rotte** è una teoria criminologica sulla **capacità del disordine** urbano e del vandalismo **di generare criminalità aggiuntiva** e comportamenti anti-sociali. La teoria afferma che mantenere e controllare ambienti urbani **reprimendo i piccoli reati**, gli atti vandalici, la deturpazione dei luoghi, il bere in pubblico, la sosta selvaggia o l'evasione nel pagamento di parcheggi, mezzi pubblici o pedaggi, contribuisce a creare un clima di ordine e legalità e **riduce il rischio di crimini più gravi**.

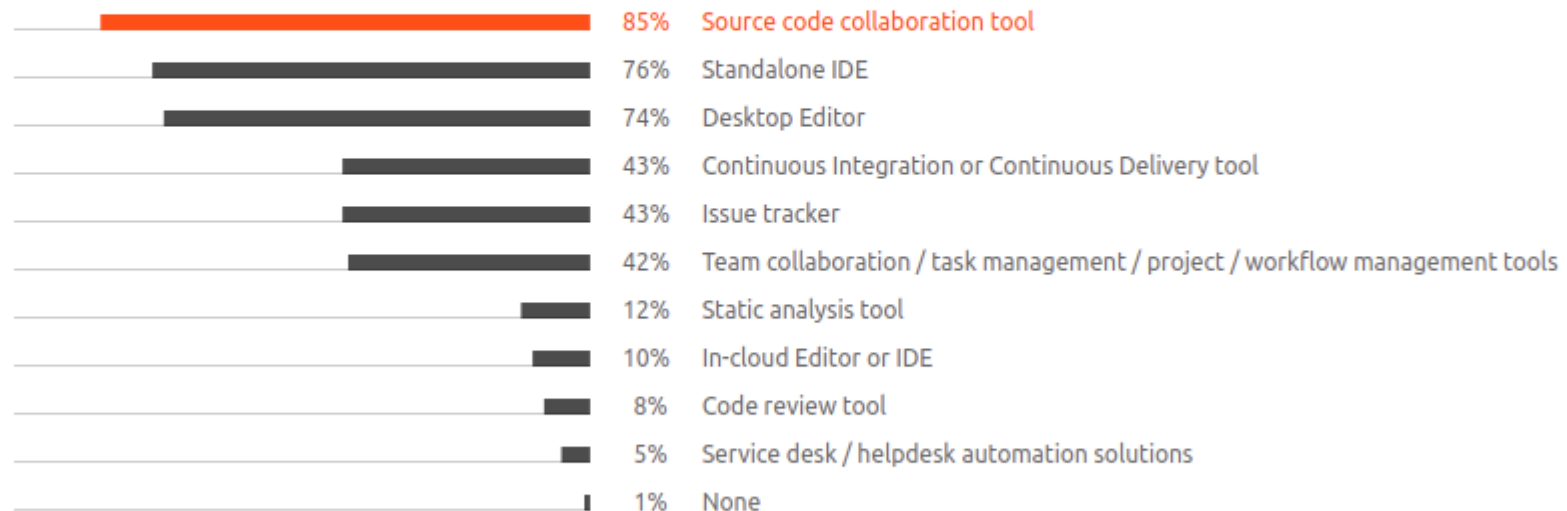

Ad esempio l'esistenza di una finestra rotta (da cui il nome della teoria) potrebbe generare fenomeni di emulazione, portando qualcun altro a rompere un lampione o un idrante, dando così inizio a una spirale di degrado urbano e sociale.

## Team Tools

Which of the following tools do you regularly use?

The use of CI / CD tools is most widespread among DevOps engineers, architects, team leads, and developer advocates.

<https://www.jetbrains.com/lp/devecosystem-2021/team-tools/>

### Funzionalità

Simili ad un correttore ortografico, permettono di:

- Imporre il rispetto di convenzioni e stili
- Verificare la congruità della documentazione
- Controllare metriche ed indicatori (complessità ciclomatica, grafo delle dipendenze, numerosità delle linee di codice)
- Ricercare codice copiato in più punti
- Ricercare errori comuni nel codice
- Misurare la percentuale di codice testato
- Ricercare indicatori di parti incomplete (p. es. tag)

### Checkstyle

Checkstyle is a development tool to help programmers write Java code that adheres to a **coding standard**. It automates the process of checking Java code to spare humans of this boring (but important) task. This makes it ideal for projects that want to **enforce a coding standard**.

Checkstyle can check many aspects of your source code. It can find class **design problems**, method design problems. It also has the ability to check code layout and formatting issues.

Per una lista dei controlli vedi qui:

<http://checkstyle.sourceforge.net/checks.html>

Esiste un plugin Maven per eseguire checkstyle:

<https://maven.apache.org/plugins/maven-checkstyle-plugin/>

### FindBugs / SpotBugs

FindBugs is a program which uses static analysis to **look for bugs in Java code**.

SpotBugs is the spiritual successor of FindBugs, carrying on from the point where it left off with support of its community.

Una lista completa dei controlli di FindBugs:

<http://findbugs.sourceforge.net/bugDescriptions.html>

Una lista completa dei controlli di SpotBugs:

<https://spotbugs.readthedocs.io/en/latest/bugDescriptions.html>

Esiste un plugin maven:

<https://spotbugs.readthedocs.io/en/latest/maven.html>

Per un esempio di possibili bug che possono essere trovati con FindBugs vedi:

<https://www.slideshare.net/caroljmcDonald/finding-bugs-that-matter-with-findbugs>

### PMD

PMD is a static source code analyzer. It **finds common programming flaws** like unused variables, empty catch blocks, unnecessary object creation, copy and paste, and so forth. It's mainly concerned with Java and Apex, but supports six other languages.

PMD features many built-in checks (in PMD lingo, rules), which are documented for each language.

[https://pmd.github.io/pmd-6.9.0/pmd\\_rules\\_java.html](https://pmd.github.io/pmd-6.9.0/pmd_rules_java.html)

Extensive API to write your own rules, which you can do either in Java or as a self-contained XPath query.

Esiste un plugin maven per pmd:

<https://maven.apache.org/plugins/maven-pmd-plugin/>

### SonarQube

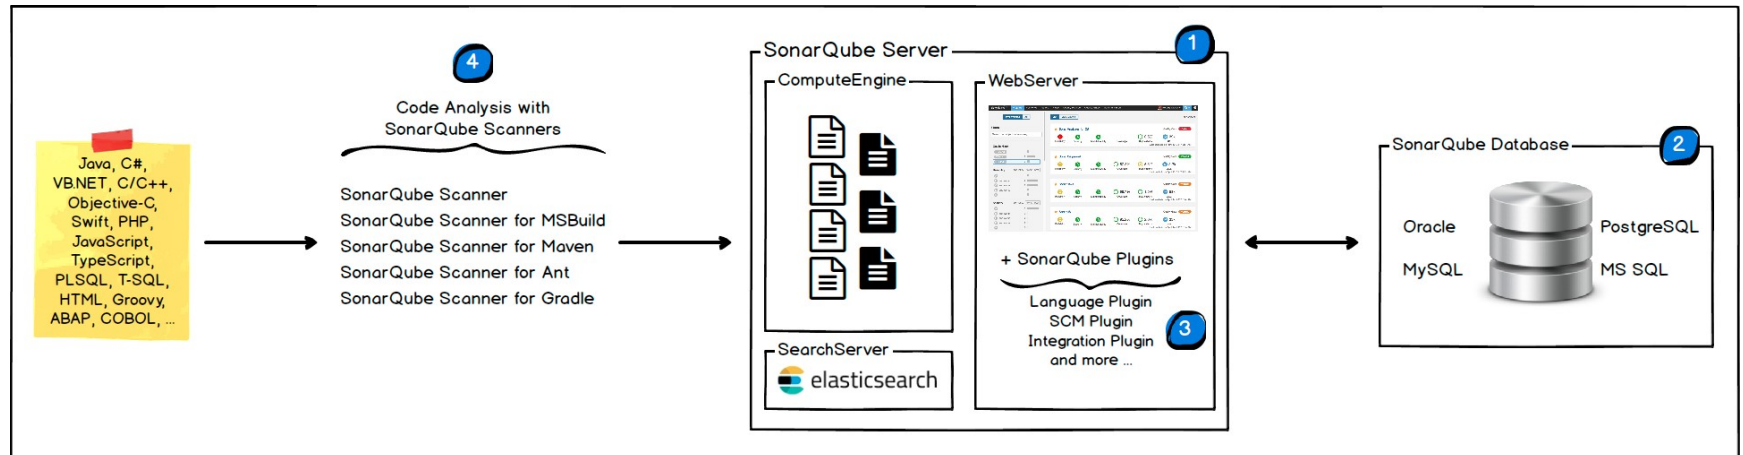

SonarQube is an automatic code review tool to detect bugs, vulnerabilities and code smells in your code. It can integrate with your existing workflow to enable **continuous code inspection** across your project branches and pull requests.

SonarQube (formerly Sonar) is an open source platform developed by SonarSource for continuous inspection of code quality to perform automatic reviews with static analysis of code to detect bugs, code smells, and security vulnerabilities on 20+ programming languages. SonarQube offers reports on duplicated code, coding standards, unit tests, code coverage, code complexity, comments, bugs, and security vulnerabilities.

SonarQube can **record metrics history and provides evolution graphs**. SonarQube's provides fully automated analysis and integration with Maven, Ant, Gradle, MSBuild and continuous integration tools (Atlassian Bamboo, Jenkins, Hudson, etc.).

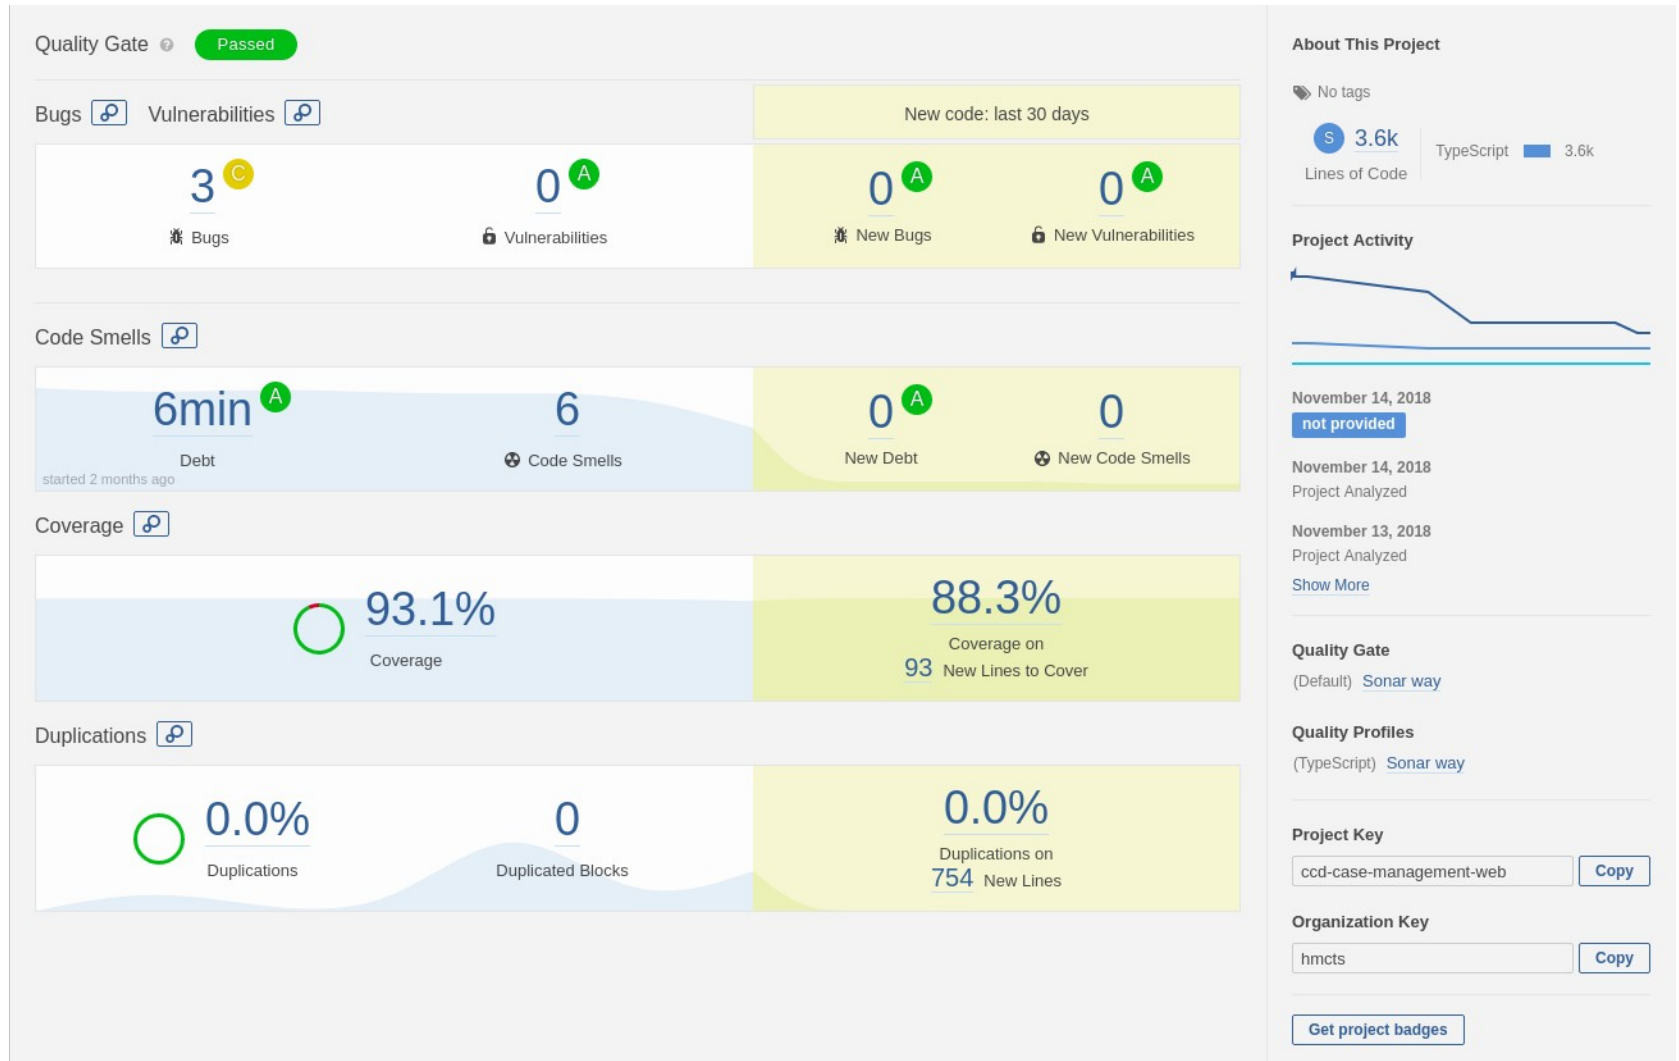

### Architettura

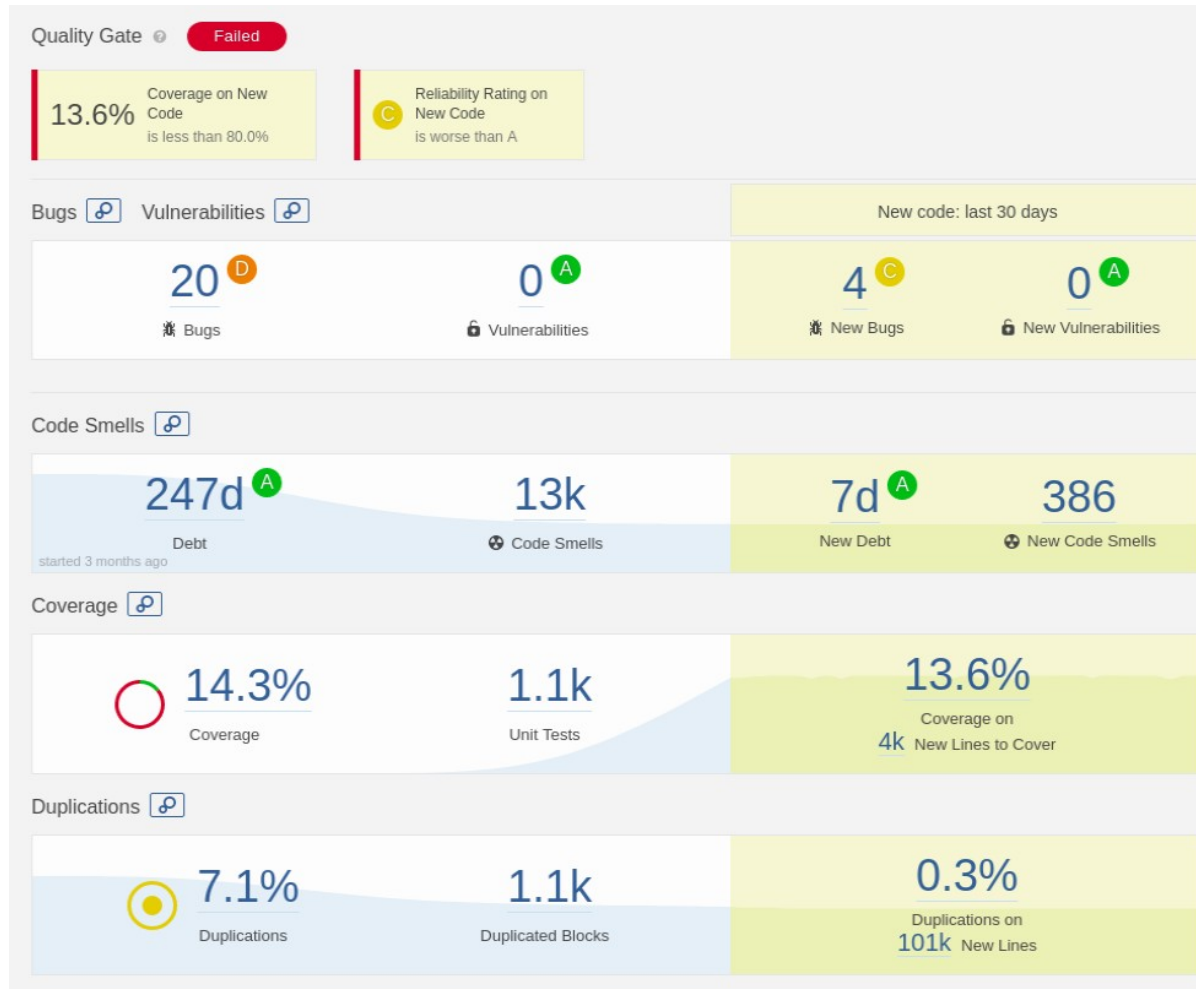

<https://docs.sonarqube.org/7.9/architecture/architecture-integration/>

### Funzionalità

- **Storicizza** l'andamento della qualità
- Permette di verificare se c'è un miglioramento o un deterioramento del progetto nel tempo
- Permette di stabilire un **quality profile** (un insieme di regole) da applicare al progetto
- Permette di stabilire un **quality gate** per verificare se la qualità del progetto rispetta determinati standard
- Le **issue** segnalate vengono classificate in base alla gravità (Blocker, Critical, Major, Minor, info)
- Le issue vengono classificate in:
  - **Vulnerabilità** → Permette di valutare il livello di sicurezza del progetto (security)
  - **Bug** → Permette di valutare l'affidabilità del progetto (Reliability)
  - **Code Smell** → Permette di valutare la mantenibilità del progetto (Maintainability)
- Permette di revisionare le issue segnalate e segnare i falsi positivi
